

TS5A22362 0.65-Ω 2-channel SPDT Analog Switches With Negative Signaling Capability

1 Features

- Specified break-before-make switching
- Negative signaling capability: maximum swing from -2.75 V to 2.75 V ($V_{CC} = 2.75\text{ V}$)
- Low ON-state resistance ($0.65\ \Omega$ typical)
- Low charge injection
- Excellent ON-state resistance matching
- 2.3-V to 5.5-V Power supply (V_{CC})
- Latch-Up performance exceeds 100 mA Per JESD 78, Class II
- ESD Performance tested per JESD 22
 - 2500-V Human-body model (A114-B, class II)
 - 1500-V Charged-device model (C101)
 - 200-V Machine model (A115-A)

2 Applications

- [Personal digital assistant \(PDAs\)](#)
- [Portable instrumentation](#)
- [Audio routing](#)
- [Medical imaging](#)

3 Description

The TS5A22362 is a bidirectional, 2-channel single-pole double-throw (SPDT) analog switch designed to operate from 2.3 V to 5.5 V. The device features negative signal swing capability that allows signals below ground to pass through the switch without distortion. The break-before-make feature prevents signal distortion during the transferring of a signal from one path to another. Low ON-state resistance, excellent channel-to-channel ON-state resistance matching, and minimal total harmonic distortion (THD) performance are ideal for audio applications. The 3.00 mm × 3.00 mm DRC package is also available as a nonmagnetic package for medical imaging application.

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The algebraic convention, whereby the most negative value is a minimum and the most positive value is a maximum
- (3) All voltages are with respect to ground, unless otherwise specified.
- (4) The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- (5) This value is limited to 5.5 V maximum.
- (6) Pulse at 1-ms duration < 10% duty cycle.
- (7) $V_{CC} = 3.0$ V to 5.0 V, $T_A = -40^\circ\text{C}$ to 85°C .
- (8) For YZP package only.

6.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8 Detailed Description

8.1 Overview

The TS5A22362 is a bidirectional, 2-channel single-pole double-throw (SPDT) analog switches designed to operate from 2.3 V to 5.5 V. The devices feature negative signal capability that allows signals below ground to pass through the switch without distortion. The break-before-make feature prevents signal distortion during the transferring of a signal from one path to another. Low ON-state resistance, excellent channel-to-channel ON-state resistance matching, and minimal total harmonic distortion (THD) performance are ideal for audio applications.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Negative Signaling Capacity

The TS5A22362 dual SPDT switches feature negative signal capability that allows signals below ground to pass through without distortion. These analog switches operate from a single +2.3-V to +5.5-V supply. The input and output signal swing of the device is dependant of the supply voltage V_{CC} : the devices pass signals as high as V_{CC} and as low as $V_{CC} - 5.5$ V, including signals below ground with minimal distortion.

Table 1 shows the input/output signal swing the user can get with different supply voltages.

Table 1. Input/Output signal swing

SUPPLY VOLTAGE, V_{CC}	MINIMUM (V_{NC} , V_{NO} , V_{COM}) = $V_{CC} - 5.5$	MAXIMUM (V_{NC} , V_{NO} , V_{COM}) = V_{CC}
5.5 V	0 V	5.5 V
4.5 V	-1.9 V	4.5 V
3.6 V	-2.5 V	3.6 V
3.0 V	-2.5 V	3.0 V
2.7 V	-2.8 V	2.7 V
2.3 V	-3.2 V	2.3 V

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Ensure that the device is powered up with a supply voltage on V_{CC} before a voltage can be applied to the signal paths NC and NO.

Tie the digitally controlled inputs select pins IN1 and IN2 to V_{CC} or GND to avoid unwanted switch states that could result if the logic control pins are left floating.

All unused digital inputs of the device must be held at V_{CC} or GND to ensure proper device operation. Refer to the TI application report, *Implications of Slow or Floating CMOS Inputs*, [SCBA004](#).

9.2 Typical Application

Figure 24. Typical Application

9.2.1 Design Requirements

Tie the digitally controlled inputs select pins IN1 and IN2 to V_{CC} or GND to avoid unwanted switch states that could result if the logic control pins are left floating.

9.2.2 Detailed Design Procedure

Select the appropriate supply voltage to cover the entire voltage swing of the signal passing through the switch because the TS5A22362 operates from a single +2.3-V to +5.5-V supply and the input/output signal swing of the device is dependant of the supply voltage V_{CC}. The device will pass signals as high as V_{CC} and as low as V_{CC} – 5.5 V. Use table 2 as a guide for selecting supply voltage based on the signal passing through the switch.

Ensure that the device is powered up with a supply voltage on V_{CC} before a voltage can be applied to the signal paths NC and NO.

10 Power Supply Recommendations

The TS5A22362 operates from a single 2.3-V to 5.5-V supply. The device must be powered up with a supply voltage on VCC before a voltage can be applied to the signal paths NC and NO. It is recommended to include a 100- μ s delay after VCC is at voltage before applying a signal on NC and NO paths

It is also good practice to place a 0.1- μ F bypass capacitor on the supply pin VCC to GND to smooth out lower frequency noise to provide better load regulation across the frequency spectrum.

11 Layout

11.1 Layout Guidelines

TI recommends placing a bypass capacitor as close to the supply pin VCC as possible to help smooth out lower frequency noise to provide better load regulation across the frequency spectrum.

Minimize trace lengths and vias on the signal paths in order to preserve signal integrity.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
