Audio DPDT Switch with Noise Suppression

Description

The NLAS6234 is a DPDT switch featuring Popless noise suppression circuitry designed to prevent pass through of undesirable transient signals known as pops. Intended for audio systems within portable applications, it provides protection against audible pops that are generated when switching between two different audio sources, such as an amplifier and a CODEC.

The NLAS6234 incorporates two double throw switches controlled by a single select line which allows the system controller to simultaneously switch between two sets of signal lines. The Popless noise suppression circuitry controls the ON and OFF times that define the time interval when switching between the normally open (NO) and normally closed (NC) terminals. This allows any pops to be dissipated within the system before the switch settles into a closed position.

The NLAS6234 operates off of a single supply voltage, V_{CC} , and is available in an ultra-thin UQFN10 package.

Features

- Popless Noise Suppression Circuitry
- OVT up to +4.5 V on Control Pin
- $R_{ON} < 0.5 \Omega$ Across BCC Range, Typical
- THD $< 0.02 \%$, Typical
- Off Isolation = -70 dB, Typical
- Crosstalk Attenuation < -70 dB, Typical
- Ultra Small, Thin Package: 1.4 mm x 1.8 mm UQFN10
- This is a Pb-Free Device

Typical Applications

- Cell Phones, PDAs, MP3 and Other Portable Media Players

Channel switch control/s test socket is normalized. Off isolation is measured across an off channel. On loss is the bandwidth of an On switch. V_{ISO} , Bandwidth and V_{ONL} are independent of the input signal direction.

$$V_{ISO} = \text{Off Channel Isolation} = 20 \text{ Log} \left(\frac{V_{OUT}}{V_{IN}} \right) \text{ for } V_{IN} \text{ at } 100 \text{ kHz}$$

$$V_{ONL} = \text{On Channel Loss} = 20 \text{ Log} \left(\frac{V_{OUT}}{V_{IN}} \right) \text{ for } V_{IN} \text{ at } 100 \text{ kHz to } 50 \text{ MHz}$$

Bandwidth (BW) = the frequency 3 dB below V_{ONL}

V_{CT} = Use V_{ISO} setup and test to all other switch analog input/outputs terminated with 50 Ω

Popless Implementation on the NLAS6234

Audio sources such as amplifiers or CODECs can generate undesirable, transient voltage spikes when powering up and down. Those voltage spikes can be translated into current surges and ultimately lead to audible pop noises in the speaker if not diverted or suppressed. The NLAS6234 includes popless noise suppression circuitry designed to prevent such undesirable pops from propagating through to the speaker. This feature is realized through a deliberate increase in the Break-Before-Make time, t_{BBM} , and is useful in applications

where a switch is used to alternate between two different audio sources.

When the signal from the common pin is removed from one terminal, the switch waits an extended amount of time before connecting to the opposite terminal. The time interval for t_{BBM} is a function of the supply voltage of the switch, V_{CC} . Figure 14 shows the relationship of t_{BBM} for each V_{CC} value within the recommended operating voltage range.
