

NCS2563

Video Amplifier, 3-Channel, with High Definition Reconstruction Filters

Description

NCS2563 is a 3-Channel high speed video amplifier with 6th order Butterworth High Definition (HD) reconstruction filters and 6 dB gain.

All three channels can accommodate all Component and RGB video signals. All channels can accept DC or AC coupled signals. If AC coupled, the internal clamps are employed. The outputs can drive both AC and DC coupled 150 Ω loads.

It is designed to be compatible with most Digital Analog Converters (DAC) embedded in most video processors.

Features

- Three 6th Order High Definition 30 MHz Filter
- Internally Fixed Gain = 6 dB
- Transparent Input Clamping for Each Channel
- DC or AC Coupled Inputs
- DC or AC Coupled Outputs
- Integrated Level Shifter
- Operating Voltage +5 V
- Available in SOIC-8 Package
- These are Pb-Free Devices

Applications

- Digital Set-Top Box
- DVD and Video Players
- HDTV
- Video-On-Demand (VOD)

NCS2563

PIN FUNCTION AND DESCRIPTION

Pin	Name	Type	Description
1	IN1	Input	Video Input 1 for Video Signal featuring a frequency bandwidth compatible with High Definition Video (30 MHz) – Channel 1
2	IN2	Input	Video Input 2 for Video Signal featuring a frequency bandwidth compatible with High Definition Video (30 MHz) – Channel 2
3	IN3	Input	Video Input 3 for Video Signal featuring a frequency bandwidth compatible with High Definition Video (30 MHz) – Channel 3
4	VCC	Power	Device Power Supply Voltage: +5 V
5	GND	GND	Connected to Ground
6	OUT3	Output	HD Video Output 3 – Channel 3
7	OUT2	Output	HD Video Output 2 – Channel 2
8	OUT1	Output	HD Video Output 1 – Channel 1

ATTRIBUTES

Characteristics	Value

Figure 1. Block Diagram

MAXIMUM RATINGS

Parameter	Symbol	Rating	Unit
Power Supply Voltages	V_{CC}	$-0.35 \leq V_{CC} \leq 5.5$	Vdc
Input Voltage Range	V_I	$-0.3 \leq V_I \leq V_{CC}$	Vdc
Input Differential Voltage Range	V_{ID}	$V_I \leq V_{CC}$	Vdc
Output Current	I_O	50	mA
Maximum Junction Temperature (Note 4)	T_J	150	°C
Operating Ambient Temperature	T_A	-40 to +85	°C
Storage Temperature Range	T_{stg}	-60 to +150	°C
Power Dissipation	P_D	(See Graph)	mW
Thermal Resistance, Junction-to-Air	$R_{\theta JA}$	112.7	°C/W

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

4. Power dissipation must be considered to ensure maximum junction temperature (T_J) is not exceeded.

Maximum Power Dissipation

The maximum power that can be safely dissipated is limited by the associated rise in junction temperature. For the plastic packages, the maximum safe junction temperature is 150°C. If the maximum is exceeded momentarily, proper circuit operation will be restored as soon as the die temperature is reduced. Leaving the device in the “overheated” condition for an extended period can result in device burnout. To ensure proper operation, it is important to observe the derating curves.

Figure 2. Power Dissipation vs Temperature

NCS2563

DC ELECTRICAL CHARACTERISTICS ($V_{CC} = +5.0\text{ V}$, $T_A = 25^\circ\text{C}$, $0.1\ \mu\text{F}$ AC coupled inputs, $R_{\text{source}} = 37.5\ \Omega$, $220\ \mu\text{F}$ AC coupled outputs into $150\ \Omega$ load, referenced to $400\ \text{kHz}$, unless otherwise specified)

Symbol	Characteristics	Conditions	Min	Typ	Max	Unit
V_{CC}	Operating Voltage Range		4.75	5	5.25	V
I_{CC}	Power Supply Current			22	33	mA
V_{IN}	Input Common Mode Voltage Range		GND		1.4	V
V_{OH}	Output High Voltage			2.8		V
V_{OL}	Output Low Voltage			280		mV

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than $500\ \text{lfpm}$. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

AC ELECTRICAL CHARACTERISTICS ($V_{CC} = +5.0\text{ V}$, $T_A = 25^\circ\text{C}$, $0.1\ \mu\text{F}$ AC coupled inputs, $R_{\text{source}} = 37.5\ \Omega$, $220\ \mu\text{F}$ AC coupled outputs into $150\ \Omega$ load, referenced to $400\ \text{kHz}$, unless otherwise specified)

Symbol	Characteristics	Conditions	Min	Typ	Max	Unit
A_{VOL}	Voltage Gain (Note 5)	$V_{IN} = 1\ \text{V}$	5.8	6.0	6.2	dB
BW	Bandwidth of Low Pass Filter	-1 dB -3 dB	23	30 33		MHz

APPLICATIONS INFORMATION

The NCS2563 triple video driver has been optimized for High Definition video applications covering the requirements of the standards 720p, 1080i and related (RGB). All the 3 channels feature the same specifications and similar behaviors guaranteed by a high channel-to-channel crosstalk isolation (down to 60 dB at 1 MHz). Each channel provides an internal voltage-to-voltage gain of 2 from its input to its output reducing by the way the number of external components usually needed in the case of some discrete approaches (using stand-alone op amps). An internal level shifter is employed shifting up the output voltage by adding an offset of about 280 mV. This avoids sync pulse clipping and allows

DC-coupled output to the 150 Ω video load. In addition, the NCS2563 integrates a 6th order Butterworth filter per channel with a 3 dB frequency bandwidth of 30 MHz. This allows rejecting out the aliases or unwanted over-sampling effects produced by the video DAC. It works the same way for DVD recorders using ADC, this anti-aliasing filter (reconstruction filter) will avoid picture quality issue and will help also to filter out parasitic signals caused by EMI interference.

A built-in diode-like clamp is used into the chip for each channel to support AC-coupled mode of operation. The clamp is active when the input signal goes below 0 V.

Figure 11. AC-Coupled Inputs and Outputs

Figure 11 shows an example for which the external video source coming from the DAC is AC-coupled at the input and output. But thanks to the built-in transparent clamp and level shifter the device can operate in different configuration modes depending essentially on the DAC output signal level High and Low and how it fits the input common mode voltage of the video driver. When the configuration is DC-Coupled at the Inputs and Outputs the 0.1 μF and 220 μF coupling capacitors are no longer used, the clamps are in that case inactive; this configuration has the big advantage of being relatively low cost with the use of less external components.

The input is AC-coupled if the input-signal amplitude goes over the range 0 V to 1.4 V or if the video source requires a coupling. In some circumstances it may be necessary to auto-bias signals by the addition of a pull-up and pull-down resistor or only pullup resistor (Typical 7.5 MΩ combined with the internal 800 kΩ pulldown) making the clamp inactive.

The output AC-coupling configuration has the advantage of eliminating DC ground loop with the drawback of making the device more sensitive to video line or field tilt issues in the case of a too low output coupling capacitor. In some cases it may be necessary to increase the nominal 220 μF capacitor value.
