SN54LS422, SN54LS423, SN74LS422, SN74LS423
RETRIGGERABLE MONOSTABLE MULTIVIBRATORS

- **Will Not Trigger from Clear**
- **D-C Triggered from Active-High or Active-Low Gated Logic Inputs**
- **Retriggerable for Very Long Output Pulses, Up to 100% Duty Cycle**
- **Overriding Clear Teminates Output Pulse**
- **'LS422 Has Internal Timing Resistor**
description

The 'LS422 and 'LS423 are identical to 'LS122 and 'LS123 except they cannot be triggered via clear.

These d-c triggered multivibrators feature output-pulse-width control by three methods. The basic pulse time is programmed by selection of external resistance and capacitance values (see typical application data). The 'LS422 contains an internal timing resistor that allows the circuits to be used with only an external capacitor, if so desired. Once triggered, the basic pulse width may be extended by retriggering the gated low-level-active (A) or high-level-active (B) inputs, or be reduced by use of the overriding clear. Figure 1 illustrates pulse control by retriggering and early clear.
The 'LS422 and 'LS423 have enough Schmitt hysteresis to ensure jitter-free triggering from the B input with transition rates as slow as 0.1 millivolt per nanosecond. The 'LS422 R_{int} is nominally 10 k ohms.

The SN54LS422 and SN54LS423 are characterized for operation over the full military temperature range of −55°C to 125°C. The SN74LS422 and SN74LS423 are characterized for operation from 0°C to 70°C.

NOTES: 1. An external timing capacitor may be connected between C_{ext} and R_{ext}/C_{ext} (positive).
2. To use the internal timing resistor of 'LS422, connect R_{int} to V_{CC}.
3. For improved pulse width accuracy and repeatability, connect an external resistor between R_{ext}/C_{ext} and V_{CC} with R_{int} open-circuited.
4. To obtain variable pulse widths, connect an external variable resistance between R_{int} or R_{ext}/C_{ext} and V_{CC}.

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.
‡ All typical values are at V_{CC} = 5 V, T_A = 25°C.
§ Not more than one output should be shorted at a time and duration of the short-circuit should not exceed one second.
NOTES: 5. To measure V_{OH} at Q, V_{OL} at $\bar{Q}$, or I_{OS} at Q, ground R_{ext}/C_{ext}, apply 2 V to B and clear, and pulse A from 2 V to 0 V.
      6. With all outputs open and 4.5 V applied to all data and clear inputs, I_{CC} is measured after a momentary ground, then 4.5 V, is applied to clock.

switching characteristics, V_{CC} = 5 V, T_A = 25°C, see note 7

¶ t_{wQ} = width of pulse output Q.
NOTE 7: Load circuits and voltage waveforms are shown in Section 1.

TYPICAL APPLICATION DATA FOR 'LS422, 'LS423†

The basic output pulse width is essentially determined by the values of external capacitance and timing resistance. For pulse widths when $C_{ext} \leq 1000$ pF, use Figure 3. For C_{ext} between 0.1 nF and 1 μF, the pulse width may be defined as:

$$t_W \approx K \cdot R_T \cdot C_{ext}$$

with K obtained from Figure 4.

When $C_{ext} \geq 1$ μF, the output pulse width is defined as:

$$t_W \approx 0.33 \cdot R_T \cdot C_{ext}$$

Where

    R_T is in kilohms (internal or external timing resistance)
    C_{ext} is in pF
    t_W is in nanoseconds

For maximum noise immunity, system ground should be applied to the C_{ext} node, even though the C_{ext} node is already tied to the ground lead internally. Due to the timing scheme used by the 'LS422 and 'LS423, a switching diode is not required to prevent reverse biasing when using electrolytic capacitors.
