Quad 2-Channel Multiplexer

MC74VHC157, MC74VHCT157A

The MC74VHC157/MC74VHCT157A is an advanced high speed CMOS quad 2−channel multiplexer fabricated with silicon gate CMOS technology. It achieves high speed operation similar to equivalent Bipolar Schottky TTL while maintaining CMOS low power dissipation.

It consists of four 2−input digital multiplexers with common select (S) and enable ($\overline{E}$) inputs. When $\overline{E}$ is held High, selection of data is inhibited and all the outputs go Low.

The select decoding determines whether the A or B inputs get routed to the corresponding Y outputs.

The MC74VHC157 inputs are compatible with standard CMOS levels while the MC74VHCT157A inputs are compatible with TTL levels. The MC74VHCT157A can be used as a level converter for interfacing 3.3 V to 5.0 V, because it has full 5.0 V CMOS level output swings.

The internal circuit is composed of three stages, including a buffer output which provides high noise immunity and stable output. The MC74VHC157 and MC74VHCT157A input structures tolerate voltages up to 5.5 V, allowing the interface of 5 V systems to 3 V systems.

The MC74VHCT157A output structures provide protection when V_{CC} = 0 V. These output structures help prevent device destruction caused by supply voltage − input/output voltage mismatch, battery backup, hot insertion, etc.
