

MC10EP90, MC100EP90

Translator, Triple ECL Input to LVPECL / PECL Output

Description

The MC10/100EP90 is a TRIPLE ECL TO LVPECL/PECL translator. The device receives differential LVECL or ECL signals and translates them to differential LVPECL or PECL output signals.

A V_{BB} output is provided for interfacing with Single-Ended LVECL or

ECL signals at the input. If a Single-Ended input is to be used the V_{BB} output should be connected to the D input. The active signal would then drive the D input. When used the $-V_{BB}$ output should be bypassed to ground by a $0.01 \mu\text{F}$ capacitor. The V_{BB} output is designed to act as the switching reference for the EP90 under Single-Ended input switching conditions, as a result this pin can only source/sink up to 0.5 mA of current.

To accomplish the level translation the EP90 requires three power rails. The V_{CC} supply should be connected to the positive supply, and the V_{EE} connected to the negative supply.

The 100 Series contains temperature compensation.

Features

- 260 ps Typical Propagation Delay
- Maximum Frequency > 3 GHz Typical
- Voltage Supplies $V_{CC} = 3.0 \text{ V}$ to 5.5 V , $V_{EE} = -3.0 \text{ V}$ to -5.5 V , $\text{GND} = 0 \text{ V}$
- Open Input Default State
- Safety Clamp on Inputs
- Fully Differential Design
- Q Output Will Default LOW with Inputs Open or at V_{EE}
- V_{BB} Output
- These are Pb-Free Devices*

14. Measured using a 750 mV source, 50% duty cycle clock source. All loading with 50 Ω to $V_{CC}-2.0\text{ V}$.

15. Skew is measured between outputs under identical transitions. Duty cycle skew is defined only for differential operation when the delays are measured from the cross point of the inputs to the cross point of the outputs.
