NCL30080

Quasi-Resonant Primary Side Current-Mode Controller for LED Lighting

The NCL30080 is a PWM current mode controller targeting isolated flyback and non-isolated constant current topologies. The controller operates in a quasi-resonant mode to provide high efficiency. Thanks to a novel control method, the device is able to precisely regulate a constant LED current from the primary side. This removes the need for secondary side feedback circuitry, biasing and an optocoupler.

The device is highly integrated with a minimum number of external components. A wide V_{CC} range simplifies the design process and allows a single design to support a wide LED forward voltage range. A robust suite of safety protection is built in to simplify the design. This device is specifically intended for very compact space efficient designs.

Features

- Quasi-resonant Peak Current-mode Control Operation
- Primary Side Sensing (no optocoupler needed)
- Wide V_{CC} Range
- Precise LED Constant Current Regulation ±1% Typical
- Line Feed-forward for Enhanced Regulation Accuracy
- Low LED Current Ripple
- 250 mV ±2% Guaranteed Voltage Reference for Current Regulation
- ~ 0.9 Power Factor with Valley Fill Input Stage
- Low LED Current Ripple
- Source 300 mA / Sink 500 mA Totem Pole Driver with 12 V Gate Clamp
- Low Start-up Current (13 µA typ.)
- Small Space Saving Low Profile Package
- Wide Temperature Range of −40 to +125°C
- Pb-free, Halide-free MSL1 Product
- Robust Protection Features
  - Over Voltage / LED Open Circuit Protection
  - Secondary Diode Short Protection
  - Output Short Circuit Protection
  - Shorted Current Sense Pin Fault Detection
  - Latched and Auto-recoverable Versions
  - Brown-out
 - V_{CC} Under Voltage Lockout
  - Thermal Shutdown

NCL30080

Figure 1. Typical Application Schematic for NCL30080

Table 1. PIN FUNCTION DESCRIPTION

| Pin No	Pin Name	Function	Pin Description
1	ZCD	Zero Crossing Detection	Connected to the auxiliary winding; this pin detects the core reset event.
2	GND	–	The controller ground
3	CS	Current sense	This pin monitors the primary peak current
4	DRV	Driver output	The current capability of the totem pole gate drive (+0.3/–0.5 A) makes it suitable to effectively drive a broad range of power MOSFETs.
5	VCC	Supplies the controller	This pin is connected to an external auxiliary voltage.
6	VIN	Input voltage sensing Brown−Out	This pin observes the HV rail and is used in valley selection. This pin also monitors and protects for low mains conditions.

Table 2. MAXIMUM RATINGS TABLE

Symbol	Rating	Value	Unit
$V_{CC(MAX)}$ $I_{CC(MAX)}$	Maximum Power Supply voltage, VCC pin, continuous voltage Maximum current for VCC pin	−0.3, +35 Internally limited	V mA
$V_{DRV(MAX)}$ $I_{DRV(MAX)}$	Maximum driver pin voltage, DRV pin, continuous voltage Maximum current for DRV pin	−0.3, V_{DRV} (Note 1) −500, +800	V mA
V_{MAX} I_{MAX}	Maximum voltage on low power pins (except pins DRV and VCC) Current range for low power pins (except pins ZCD, DRV and VCC)	−0.3, +5.5 −2, +5	V mA
$V_{ZCD(MAX)}$ $I_{ZCD(MAX)}$	Maximum voltage for ZCD pin Maximum current for ZCD pin	−0.3, +10 −2, +5	V mA
$R_{\theta J-A}$	Thermal Resistance, Junction−to−Air	360	°C/W
$T_{J(MAX)}$	Maximum Junction Temperature	150	°C
	Operating Temperature Range	−40 to +125	°C
	Storage Temperature Range	−60 to +150	°C
	ESD Capability, HBM model (Note 2)	4	kV
	ESD Capability, MM model (Note 2)	200	V

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.
1. V_{DRV} is the DRV clamp voltage $V_{DRV(high)}$ when V_{CC} is higher than $V_{DRV(high)}$. V_{DRV} is V_{CC} unless otherwise noted.
2. This device series contains ESD protection and exceeds the following tests: Human Body Model 4000 V per JEDEC JESD22−A114−F and Machine Model Method 200 V per JEDEC JESD22−A115−A.
3. This device contains latch−up protection and exceeds 100 mA per JEDEC Standard JESD78 except for VIN pin which passes 60 mA.

Table 3. ELECTRICAL CHARACTERISTICS (Unless otherwise noted: For typical values T_J = 25°C, V_{CC} = 12 V;
For min/max values T_J = −40°C to +125°C, Max T_J = 150°C, V_{CC} = 12 V)

Application Information

The **NCL30080** implements a current−mode architecture operating in quasi−resonant mode. Thanks to proprietary circuitry, the controller is able to accurately regulate the secondary side current of the flyback converter without using any opto−coupler or measuring directly the secondary side current.

- **Quasi−Resonance Current−Mode Operation:** implementing quasi−resonance operation in peak current−mode control, the NCL30080 optimizes the efficiency by switching in the valley of the MOSFET drain−source voltage. Thanks to a smart control algorithm, the controller locks−out in a selected valley and remains locked until the input voltage or the output current set point significantly changes.
- **Primary Side Constant Current Control:** thanks to a proprietary circuit, the controller is able to compensate for the leakage inductance of the transformer and allow accurate control of the secondary side current.
- **Line Feed−forward:** compensation for possible variation of the output current caused by system slew rate variation.
- **Open LED protection:** if the voltage on the VCC pin exceeds an internal limit, the controller shuts down and waits 4 seconds before restarting switching.

- **Brown−Out:** the controller includes a brown−out circuit with a validation timer which safely stops the controller in the event that the input voltage is too low. The device will automatically restart if the line recovers.
- **Cycle−by−cycle peak current limit:** when the current sense voltage exceeds the internal threshold V_{ILIM}, the MOSFET is turned off for the rest of the switching cycle.
- **Winding Short−Circuit Protection:** an additional comparator with a short LEB filter (t_{BCS}) senses the CS signal and stops the controller if V_{CS} reaches 1.5 x V_{ILIM}. For noise immunity reasons, this comparator is enabled only during the main LEB duration t_{LEB}.
- **Output Short−circuit protection:** If a very low voltage is applied on ZCD pin for 90 ms (nominal), the controllers assume that the output or the ZCD pin is shorted to ground and enters shutdown. The auto−restart version (B suffix) waits 4 seconds, then the controller restarts switching. In the latched version (A suffix), the controller is latched as long as V_{CC} stays above the $V_{CC(reset)}$ threshold.

Constant Current Control

Figure 27 shows the basic circuit of a flyback converter. Figure 28 portrays the primary and secondary current of a flyback converter operating in discontinuous conduction mode (DCM).

Figure 27. Basic Flyback Converter Schematic

During the on–time of the MOSFET, the bulk voltage V_{bulk} is applied to the magnetizing and leakage inductors L_p and L_{leak} and the current ramps up.

When the MOSFET is turned–off, the inductor current first charges C_{lump}. The output diode is off until the voltage across L_p reverses and reaches:

$$N_{sp}\left(V_{out} + V_f\right) \qquad \text{(eq. 1)}$$

The output diode current increase is limited by the leakage inductor. As a result, the secondary peak current is reduced:

$$I_{D,pk} < \frac{I_{L,pk}}{N_{sp}} \qquad \text{(eq. 2)}$$

The diode current reaches its peak when the leakage inductor is reset. Thus, in order to accurately regulate the output current, we need to take into account the leakage inductor current. This is accomplished by sensing the clamping network current. Practically, a node of the clamp capacitor is connected to R_{sense} instead of the bulk voltage V_{bulk}. Then, by monitoring the voltage on the CS pin, we have an image of the primary current (red curve in Figure 28).

When the diode conducts, the secondary current decreases linearly from $I_{D,pk}$ to zero. When the diode current has turned off, the drain voltage begins to oscillate because of the resonating network formed by the inductors (L_p+L_{leak}) and the lump capacitor. This voltage is reflected on the auxiliary winding wired in flyback mode. Thus, by monitoring the auxiliary winding voltage, we can detect the end of the conduction time of secondary diode. The constant current control block picks up the leakage inductor current, the end of conduction of the output rectifier and controls the drain current to maintain the output current constant.

We have:

$$I_{out} = \frac{V_{REF}}{2N_{sp}R_{sense}} \qquad \text{(eq. 3)}$$

The output current value is set by choosing the sense resistor:

$$R_{sense} = \frac{V_{ref}}{2N_{sp}I_{out}} \qquad \text{(eq. 4)}$$

From Equation 3, the first key point is that the output current is independent of the inductor value. Moreover, the leakage inductance does not influence the output current value as the reset time is processed by the controller.

Figure 28. Flyback Currents and Auxiliary Winding Voltage in DCM

Internal Soft−Start

At startup or after recovering from a fault, there is a small internal soft−start of 40 μs.

In addition, during startup, as the output voltage is zero volts, the demagnetization time is long and the constant current control block will slowly increase the peak current towards its nominal value as the output voltage grows. Figure 29 shows a soft−start simulation example for a 9 W LED driver illustrating a natural soft startup.

Figure 29. Startup Simulation Showing the Natural Soft−start

Cycle−by−Cycle Current Limit

When the current sense voltage exceeds the internal threshold V_{ILIM}, the MOSFET is turned off for the rest of the switching cycle (Figure 30).

Winding and Output Diode Short−Circuit Protection

In parallel with the cycle−by−cycle sensing of the CS pin, another comparator with a reduced LEB (t_{BCS}) and a higher threshold (1.5 V typical) is integrated to sense a winding short−circuit and immediately stops the DRV pulses. The controller goes into auto−recovery mode in version B.

In version A, the controller is latched. In latch mode, the DRV pulses stop and VCC ramps up and down. The circuit un−latches when VCC pin voltage drops below $V_{CC(reset)}$ threshold.
NCL30080

Figure 30. Winding Short Circuit Protection, Max. Peak Current Limit Circuits

V$_{CC}$ Over Voltage Protection (Open LED Protection)

If no output load is connected to the LED string fails open circuited, the controller must be able to safely limit the output voltage excursion.

In the NCL30080, when the V$_{CC}$ voltage reaches the V$_{CC(OVP)}$ threshold, the controller stops the DRV pulses and the 4−s timer starts counting. The IC re−start switching after the 4−s timer has elapsed as long as V$_{CC} \geq$ V$_{CC(on)}$. This is illustrated in Figure 31.
Figure 31. Open LED Protection Chronograms

Valley Lockout

Quasi−square wave resonant systems have a wide switching frequency excursion. The switching frequency increases when the output load decreases or when the input voltage increases. The switching frequency of such systems must be limited.

The NCL30080 changes the valley as the input voltage increases. This limits the switching frequency excursion. Once a valley is selected, the controller stays locked in the valley until the input voltage varies significantly. This avoids valley jumping and the inherent noise caused by this phenomenon.

The input voltage is sensed by the VIN pin. The internal logic selects the operating valley according to VIN pin voltage (line range detection in Figure 32). For a universal mains design, the controller operates in the first valley at low line and in the second valley at high line.
Figure 32. Line Range Detection

Table 4. VALLEY SELECTION

Valley number	VIN pin voltage for valley change				
	V_{VIN} decreases ←				
	0	−LL−	2.3 V	−HL−	5 V
	1st		2nd		
	0	−LL−	2.4 V	−HL−	5 V
	V_{VIN} increases →				
	VIN pin voltage for valley change				

Zero Crossing Detection Block

The ZCD pin detects when the drain-source voltage of the power MOSFET reaches a valley.

A valley is detected when the voltage on pin 1 crosses below the $V_{ZCD(THD)}$ internal threshold.

At startup or in case of extremely damped free oscillations, the ZCD comparator may not be able to detect the valleys. To avoid such a situation, the NCL30080 features a time-out circuit that generates pulses if the voltage on ZCD pin stays below the $V_{ZCD(THD)}$ threshold for 6.5 μs (nominal).

The time-out also acts as a substitute clock for the valley detection and simulates a missing valley in case of very damped free oscillations.
Figure 33. Time–out Chronograms

Normally with this type of time–out function, in the event the ZCD pin or the auxiliary winding is shorted, the controller could continue switching leading to improper regulation of the LED current. Moreover during an output short circuit, the controller will strive to maintain constant current operation.

To avoid these scenarios, a protection circuit consisting of a comparator and secondary timer starts counting when the ZCD voltage is below the $V_{ZCD(short)}$ threshold. If this timer reaches 90 ms, the controller detects a fault and shutdown. The auto–restart version (B suffix) waits 4 seconds, then the controller restarts switching. In the latched version (A suffix), the controller is latched as long as V_{CC} stays above the $V_{CC(reset)}$ threshold.

Line Feed–forward

Because of internal and external propagation delays, the MOSFET is not turned–off immediately when the current set–point is reached. As a result, the primary peak current is slightly higher than expected resulting in a small output current error which can be compensated for during component selection.

Normally this error would increase if the input line voltage increased because the slew rate through the primary inductance would increase. To compensate for the peak current increase brought by the variation, a positive voltage proportional to the line voltage is added to the current sense signal. The amount of offset voltage can be adjusted using the R_{LFF} resistor as shown in Figure 34.

$$V_{CS(offset)} = K_{LFF}V_{pinVIN}R_{CS} \qquad \text{(eq. 5)}$$

The offset voltage is applied only during the MOSFET on–time.
Figure 34. Line Feed–forward Schematic

Brown–out

In order to protect the supply against a very low input voltage, the NCL30080 features a brown–out circuit with a fixed ON/OFF threshold. The controller is allowed to start if a voltage higher than 1 V is applied to the VIN pin and shuts–down if the VIN pin voltage decreases and stays below 0.9 V for 50 ms nominal. Exiting a brown–out condition overrides the hiccup on V_{CC} (V_{CC} does not wait to reach $V_{CC(off)}$) and the IC immediately goes into startup mode ($I_{CC} = I_{CC(start)}$). Note for most compact LED driver applications, if a true line dropout occurs, the energy in the input bulk capacitor will be discharged and the LED load will turn off before the 50 ms timer expires.
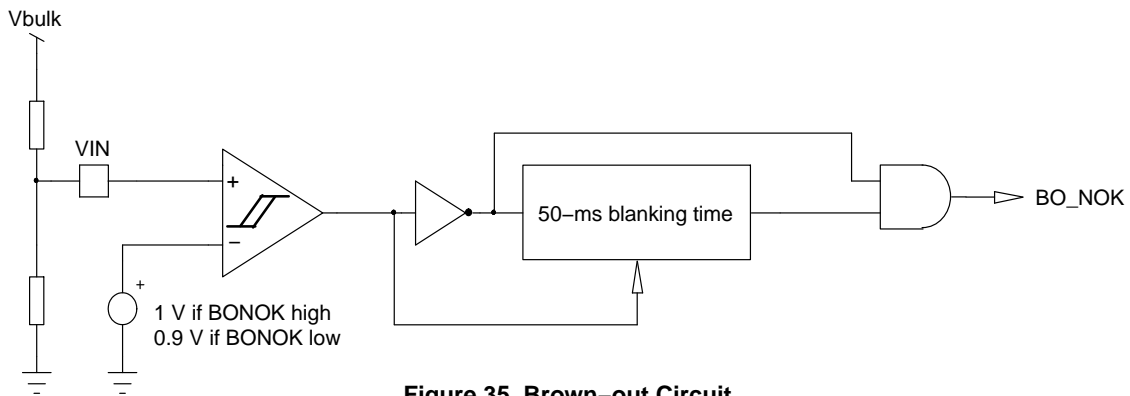

Figure 35. Brown–out Circuit
Figure 36. Brown−Out Chronograms (Valley Fill circuit is used)

CS Pin Short Circuit Protection

With a traditional controller, if the CS pin or the sense resistor is shorted to ground, the driver will not be able to turn off, leading to potential damage of the power supply. To avoid this, the NCL30080 features a circuit to protect the power supply against a short circuit of the CS pin. When the MOSFET is on, if the CS voltage stays below $V_{CS(low)}$ after the adaptive blanking timer has elapsed, the controller shuts down and will attempt to restart on the next V_{CC} hiccup.
Figure 37. CS Pin Short Circuit Protection Schematic

Fault Management

OFF Mode

The circuit turns off whenever a major condition prevents it from operating:

- Incorrect feeding of the circuit: "UVLO high". The UVLO signal becomes high when V_{CC} drops below $V_{CC(off)}$ and remains high until V_{CC} exceeds $V_{CC(on)}$.
- V_{CC} OVP
- Output diode short circuit protection: "WOD_SCP high"
- Output / Auxiliary winding Short circuit protection: "Aux_SCP high"
- Die over temperature (TSD)
- Brown−Out: "BO_NOK" high
- Pin CS short circuited to GND: "CS_short high"

In this mode, the DRV pulses are stopped. V_{CC} voltage decrease through the controller own consumption (I_{CC1}).

For the output diode short circuit protection, the output / aux. winding short circuit protection and the V_{CC} OVP, the controller waits 4 seconds (auto−recovery timer) and then initiates a startup sequence ($V_{CC} \geq V_{CC(on)}$) before re−starting switching.

Latch Mode

This mode is activated by the output diode short−circuit protection (WOD_SCP) and the Aux_SCP in **version A only.**

In this mode, the DRV pulses are stopped and the controller is latched. There are hiccups on V_{CC}.

The circuit un−latches when $V_{CC} < V_{CC(reset)}$.

CASE 318G
ISSUE W

GENERIC
MARKING DIAGRAM*
XXXAYW■	XXX M■
IC	STANDARD

XXX = Specific Device Code
A   = Assembly Location
Y   = Year
W   = Work Week
■   = Pb−Free Package

XXX = Specific Device Code
M   = Date Code
■   = Pb−Free Package

*This information is generic. Please refer to device data
sheet for actual part marking. Pb−Free indicator, "G"
or microdot "■", may or may not be present. Some
products may not follow the Generic Marking.

STYLE 1:
PIN 1. DRAIN
    2. DRAIN
    3. GATE
    4. SOURCE
    5. DRAIN
    6. DRAIN

STYLE 2:
PIN 1. EMITTER 2
    2. BASE 1
    3. COLLECTOR 1
    4. EMITTER 1
    5. BASE 2
    6. COLLECTOR 2

STYLE 3:
PIN 1. ENABLE
    2. N/C
    3. R BOOST
    4. Vz
    5. V in
    6. V out

STYLE 4:
PIN 1. N/C
    2. V in
    3. NOT USED
    4. GROUND
    5. ENABLE
    6. LOAD

STYLE 5:
PIN 1. EMITTER 2
    2. BASE 2
    3. COLLECTOR 1
    4. EMITTER 1
    5. BASE 1
    6. COLLECTOR 2

STYLE 6:
PIN 1. COLLECTOR
    2. COLLECTOR
    3. BASE
    4. EMITTER
    5. COLLECTOR
    6. COLLECTOR

STYLE 7:
PIN 1. COLLECTOR
    2. COLLECTOR
    3. BASE
    4. N/C
    5. COLLECTOR
    6. EMITTER

STYLE 8:
PIN 1. Vbus
    2. D(in)
    3. D(in)+
    4. D(out)+
    5. D(out)
    6. GND

STYLE 9:
PIN 1. LOW VOLTAGE GATE
    2. DRAIN
    3. SOURCE
    4. DRAIN
    5. DRAIN
    6. HIGH VOLTAGE GATE

STYLE 10:
PIN 1. D(OUT)+
    2. GND
    3. D(OUT)−
    4. D(IN)−
    5. VBUS
    6. D(IN)+

STYLE 11:
PIN 1. SOURCE 1
    2. DRAIN 2
    3. DRAIN 2
    4. SOURCE 2
    5. GATE 1
    6. DRAIN 1/GATE 2

STYLE 12:
PIN 1. I/O
    2. GROUND
    3. I/O
    4. I/O
    5. VCC
    6. I/O

STYLE 13:
PIN 1. GATE 1
    2. SOURCE 2
    3. GATE 2
    4. DRAIN 2
    5. SOURCE 1
    6. DRAIN 1

STYLE 14:
PIN 1. ANODE
    2. SOURCE
    3. GATE
    4. CATHODE/DRAIN
    5. CATHODE/DRAIN
    6. CATHODE/DRAIN

STYLE 15:
PIN 1. ANODE
    2. SOURCE
    3. GATE
    4. DRAIN
    5. N/C
    6. CATHODE

STYLE 16:
PIN 1. ANODE/CATHODE
    2. BASE
    3. EMITTER
    4. COLLECTOR
    5. ANODE
    6. CATHODE

STYLE 17:
PIN 1. EMITTER
    2. BASE
    3. ANODE/CATHODE
    4. ANODE
    5. CATHODE
    6. COLLECTOR
