

## 4.5-V TO 16-V INPUT, HIGH CURRENT, SYNCHRONOUS STEP DOWN DUAL BUCK CONVERTER WITH INTEGRATED FETS

Check for Samples: [TPS65253](#)

### FEATURES

- **Wide Input Supply Voltage Range:**  
4.5 V - 16 V
- **Output Range:** 0.8 V to  $\sim V_{IN}-1$  V
- **Fully Integrated Dual Buck, 3.5-A/2.5-A Continuous Current (4-A/3-A Maximum Current)**
- **High Efficiency**
- **300-kHz - 1.2-MHz Switching Frequency Set by External Resistor**
- **External Enable/Sequencing Pins**
- **Adjustable Cycle-by-Cycle Current Limit Set by External Resistor**
- **Soft-Start Pins**

- **Current-Mode Control With Simple Compensation Circuit**
- **Power Good and Reset Generator**
- **Low Power Mode Set By External Signal**
- **Supervisory Circuit**
- **QFN Package, 28-Pin 5 mm x 5 mm RHD**

### APPLICATIONS

- **DTV**
- **DSL Modems**
- **Cable Modems**
- **Set Top Boxes**
- **Car DVD Players**
- **Home Gateway and Access Point Networks**
- **Wireless Routers**

### DESCRIPTION/ORDERING INFORMATION

The TPS65253 features two synchronous wide input range high efficiency buck converters. The converters are designed to simplify product application while giving designers the options to optimize their usage according to the target application.

The converters can operate in 5-, 9- and 12-V systems and have integrated power transistors. The output voltage can be set externally using a resistor divider to any value between 0.8 V and the input supply minus 1 V. Each converter features an enable pin that allows a delayed start-up for sequencing purposes, soft-start pin that allows adjustable soft-start time by choosing the soft-start capacitor, and a current limit (RLIMx) pin that enables designer to adjust current limit by selecting an external resistor and optimize the choice of inductor. The CMP pin allows optimizing transient versus dc accuracy response with a simple RC compensation.

The switching frequency of the converters is set by an external resistor connected to R<sub>OSC</sub> pin. The switching regulators are designed to operate from 300 kHz to 1.2 MHz. The converters operate with 180° phase between them to minimize the input filter requirements.

TPS65253 also features a low power mode enabled by an external signal, which allows for a reduction on the input power supplied to the system when the host processor is in stand-by (low activity) mode.

TPS65253 features a supervisor circuit that monitors both converters and provides a PGOOD signal (End of Reset) with a 32-ms timer.

TPS65253 is packaged in a small, thermally efficient 28-pin QFN package.

(1) For the most current packaging and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at [www.ti.com](http://www.ti.com).

(2) Package drawings, thermal data, and symbolization are available at [www.ti.com/packaging](http://www.ti.com/packaging).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**TERMINAL FUNCTIONS**

NAME	NO.	I/O	DESCRIPTION
ROSC	1	I	Oscillator set. This resistor sets the frequency of internal autonomous clock.
FB1	2	I	Feedback pin for Buck 1. Connect a divider set to 0.8 V from the output of the converter to ground.
CMP1	3	O	Compensation pin for Buck 1. Fit a series RC circuit to this pin to complete the compensation circuit of this converter.
SS1	4	I	Soft-start pin for Buck 1. Fit a small ceramic capacitor to this pin to set the converter soft-start time.
RLIM1	5	I	Current limit setting pin for Buck 1. Fit a resistor from this pin to ground to set the peak current limit on the output inductor.
EN1	6	I	Enable pin for Buck 1. A high signal on this pin enables the regulator Buck. For a delayed start-up add a small ceramic capacitor from this pin to ground.
BST1	7	I	Bootstrap capacitor for Buck 1. Fit a 47-nF ceramic capacitor from this pin to the switching node.
VIN1	8	I	Input supply for Buck 1. Fit a 10- $\mu$ F ceramic capacitor close to this pin.
LX1	9, 10	O	Switching node for Buck 1
LX2	11, 12	O	Switching node for Buck 2
VIN2	13	I	Input supply for Buck 2. Fit a 10- $\mu$ F ceramic capacitor close to this pin.
BST2	14	I	Bootstrap capacitor for Buck 1. Fit a 47-nF ceramic capacitor from this pin to the switching node.
EN2	15	I	Enable pin for Buck 2. A high signal on this pin enables the regulator Buck. For a delayed start-up add a small ceramic capacitor from this pin to ground.
RLIM2	16	I	Current limit setting pin for Buck 2. Fit a resistor from this pin to ground to set the peak current limit on the output inductor.
SS2	17	I	Soft-start pin for Buck 2. Fit a small ceramic capacitor to this pin to set the converter soft-start time.
CMP2	18	O	Compensation pin for Buck 2. Fit a series RC circuit to this pin to complete the compensation circuit of this converter.
FB2	19	I	Feedback pin for Buck 2. Connect a divider set to 0.8 V from the output of the converter to ground.
LOW_P	20	I	Low power operation mode (active high) input for TPS65253
V7V	21	O	Internal supply. Connect a 4.7- $\mu$ F to 10- $\mu$ F ceramic capacitor from this pin to ground.
V3V	22	O	Internal supply. Connect a 3.3- $\mu$ F to 10- $\mu$ F ceramic capacitor from this pin to ground.
GND	23, 25, 26, 27, 28		Ground
PGOOD	24	O	Open drain power good output
PowerPAD			PowerPAD. Connect to system ground for electrical and thermal connection.

**ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>**

over operating free-air temperature range (unless otherwise noted)

	Voltage range at VIN1, VIN2, LX1, LX2	-0.3 to 18	V
	Voltage range at LX1, LX2 (maximum withstand voltage transient < 20 ns) <sup>(2)</sup>	-3 to 18	V
	Voltage at BST1, BST2, referenced to LX pin	-0.3 to 7	V
	Voltage at V7V, CMP1, CMP2	-0.3 to 7	V
	Voltage at V3V, RLIM1, RLIM2, EN1, EN2, SS1, SS2, FB1, FB2, PGOOD, ROSC, LOW_P	-0.3 to 3.6	V
	Voltage at GND	-0.3 to 0.3	V
T <sub>J</sub>	Operating virtual junction temperature range	-40 to 125	°C
T <sub>STG</sub>	Storage temperature range	-55 to 150	°C

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Excessive parasitic inductance may cause deeper negative voltage for less than 20 ns. To minimize this undershoot tight board layout is recommended.

## OVERVIEW

TPS65253 is a power management IC with two step-down buck converters. Both high-side and low-side MOSFETs are integrated to provide fully synchronous conversion with higher efficiency. TPS65253 can support 4.5-V to 16-V input supply, high load current, 300-kHz to 1.2-MHz clocking. The buck converters have an optional PFM mode, which can improve power dissipation at light loads. Alternatively, the device implements a constant frequency mode by connecting the LOW\_P pin to ground. The wide switching frequency of 300 kHz to 1.2 MHz allows for efficiency and size optimization. The switching frequency is adjustable by selecting a resistor to ground on the ROsc pin. Input ripple is reduced by 180° out-of-phase operation between Buck 1 and Buck 2.

Both buck converters have peak current mode control which simplifies external frequency compensation. A traditional type II compensation network can stabilize the system and achieve fast transient response. Moreover, an optional capacitor in parallel with the upper resistor of the feedback divider provides one more zero and makes the crossover frequency over 100 kHz.

Each buck converter has an individual current limit, which can be set up by a resistor to ground from the RLIMx pin. The adjustable current limiting enables high efficiency design with smaller and less expensive inductors.

The device has two built-in LDO regulators. During a standby mode, the 3.3-V LDO and the 6.5-V LDO can be used to drive MCU and other active loads. By this, the system is able to turn of the two buck converters and improve the standby efficiency.

The device has a power good comparator monitoring the output voltage. Each converter has its own soft-start and enable pin, which provide independent control and programmable soft-start.

## DETAILED DESCRIPTION

### Adjustable Switching Frequency

To select the internal switching frequency, connect a resistor from ROsc to ground. [Figure 19](#) shows the required resistance for a given switching frequency.

**Figure 19. ROsc vs Switching Frequency**

$$R_{osc}(k\Omega) = 174 \cdot f_{sw}^{-1.122} \quad (1)$$

## Out-of-Phase Operation

In order to reduce input ripple current, Buck 1 and Buck 2 operate 180° out-of-phase. This enables the system having less input ripple, then to lower component cost, save board space and reduce EMI.

## Startup and Sequencing

If a delayed start-up is required on any of the buck converters fit a ceramic capacitor to the ENx pins. The delay added is ~1.7 ms per nF connected to the pin. Note that the EN pins have a weak 1-MΩ pull-up to the 3V3 rail. [Figure 20](#) describes startup sequencing and PGOOD generation.

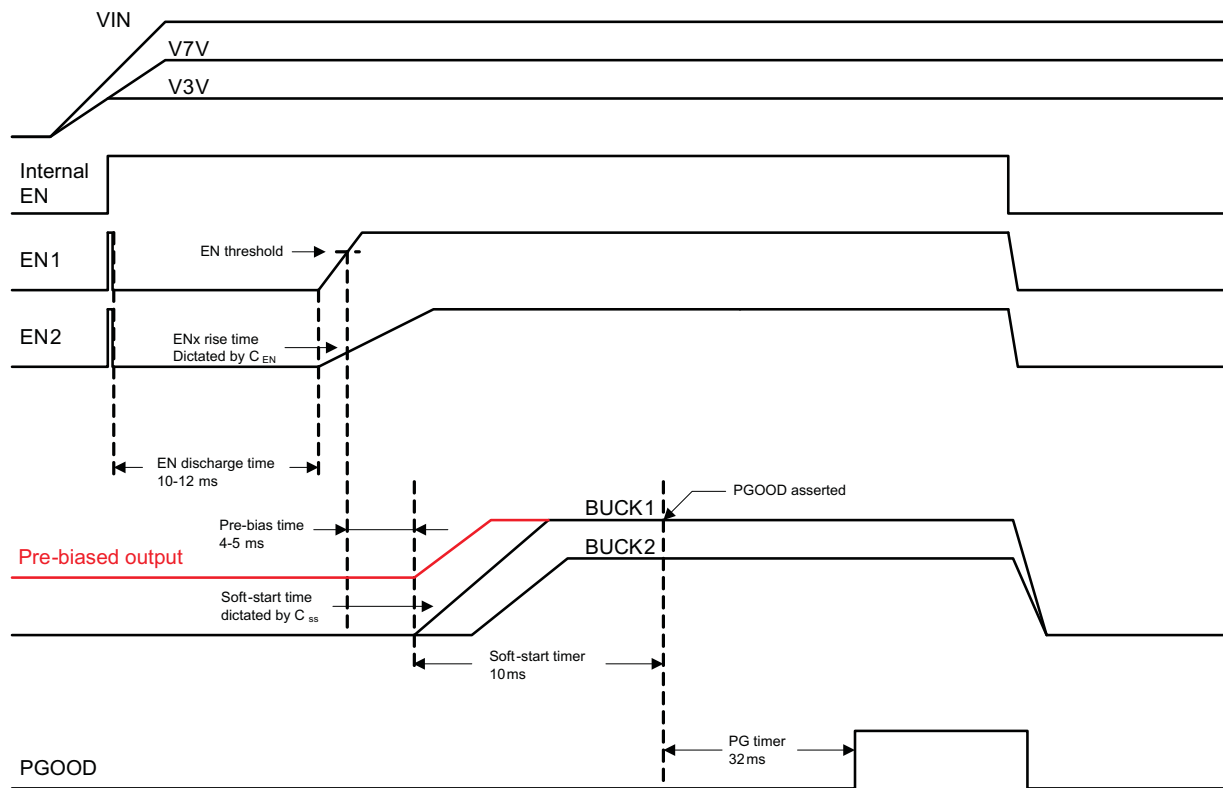

Figure 20. Startup Sequence of Dual Bucks

## Soft-Start Time

The device has an internal pull-up current source of 5 μA that charges an external soft-start capacitor to implement a slow start time. [Equation 2](#) shows how to select a soft-start capacitor based on an expected slow start time. The voltage reference ( $V_{REF}$ ) is 0.8 V and the soft-start charge current ( $I_{SS}$ ) is 5 μA. The soft-start circuit requires 1 nF per around 160 μs to be connected at the SS pin. A 0.8-ms soft-start time is implemented for all converters fitting 4.7 nF to the relevant SS pin.

$$T_{ss}(ms) = V_{REF}(V) \cdot \left( \frac{C_{ss}(nF)}{I_{ss}(\mu A)} \right) \quad (2)$$

The Power Good circuit for the bucks has a 10-ms watchdog. Therefore the soft-start time should be lower than this value. It is recommended not to exceed 5 ms.

## Adjusting the Output Voltage

The output voltage is set with a resistor divider from the output node to the FB pin. It is recommended to use 1% tolerance or better divider resistors. In order to improve efficiency at light load, start with a value close to 40 k $\Omega$  for the R1 resistor and use [Equation 3](#) to calculate R2.

$$R2 = R1 \cdot \left( \frac{0.8V}{V_o - 0.8V} \right) \quad (3)$$

Figure 21. Voltage Divider Circuit

## Loop Compensation

TPS65253 is a current mode control DC/DC converter. The error amplifier is a transconductance of 130  $\mu\text{A/V}$ . A typical compensation circuit could be type II ( $R_c$  and  $C_c$ ) to have a phase margin above 45°, or type III ( $R_c$  and  $C_c$  and  $C_{ff}$ ) to improve the converter transient response. Optional  $C_{Roll}$  adds a high frequency pole to attenuate high-frequency noise when needed. It may also prevent noise coupling from other rails if there is possibility of cross coupling in between rails when layout is very compact.

Figure 22. Loop Compensation Scheme

To calculate the external compensation components follow the following steps:

	TYPE II CIRCUIT	TYPE III CIRCUIT
Select switching frequency that is appropriate for application depending on L, C sizes, output ripple, EMI concerns and etc. Switching frequencies around 500 kHz yield best trade off between performance and cost. When using smaller L and C, switching frequency can be increased. To optimize efficiency, switching frequency can be lowered.		Use type III circuit for switching frequencies higher than 500 kHz.
Select cross over frequency ( $f_c$ ) to be at least 1/5 to 1/10 of switching frequency ( $f_s$ ).	Suggested $f_c = f_s/10$	Suggested $f_c = f_s/10$
Set and calculate $R_c$ .	$R_c = \frac{2\pi \cdot f_c \cdot V_o \cdot C_o}{g_M \cdot V_{ref} \cdot g_{m_{ps}}}$	$R_c = \frac{2\pi \cdot f_c \cdot V_o \cdot C_o}{g_M \cdot V_{ref} \cdot g_{m_{ps}}}$
Calculate $C_c$ by placing a compensation zero at or before the converter dominant pole $f_p = \frac{1}{C_o \cdot R_L \cdot 2\pi}$	$C_c = \frac{R_L \cdot C_o}{R_c}$	$C_c = \frac{R_L \cdot C_o}{R_c}$
Add $C_{Roll}$ if needed to remove large signal coupling to high impedance CMP node. Make sure that $f_{p_{Roll}} = \frac{1}{2 \cdot \pi \cdot R_c \cdot C_{Roll}}$ is at least twice the cross over frequency.	$C_{Roll} = \frac{R_{esr} \cdot C_o}{R_c}$	$C_{Roll} = \frac{R_{esr} \cdot C_o}{R_c}$
Calculate $C_{ff}$ compensation zero at low frequency to boost the phase margin at the crossover frequency. Make sure that the zero frequency ( $f_{z_{ff}}$ ) is smaller than equivalent soft-start frequency ( $1/T_{ss}$ ).	NA	$C_{ff} = \frac{1}{2 \cdot \pi \cdot f_{z_{ff}} \cdot R_1}$

## Slope Compensation

The device has a built-in slope compensation ramp. The slope compensation can prevent sub harmonic oscillations in peak current mode control.

## Input Capacitor

Use at least 10- $\mu$ F X7R/X5R ceramic capacitors at the input of the converter inputs. These capacitors should be connected as close as physically possible to the input pins of the converters.

## Bootstrap Capacitor

The device has two integrated boot regulators and requires a small ceramic capacitor between the BST and LX pins to provide the gate drive voltage for the high side MOSFET. The value of the ceramic capacitor should be 0.047  $\mu$ F. A ceramic capacitor with an X7R or X5R grade dielectric is recommended because of the stable characteristics over temperature and voltage.

## Power Good

The PGOOD pin is an open drain output. The PGOOD pin is pulled low when any buck converter is pulled below 85% of the nominal output voltage. The PGOOD is pulled up when both buck converters' outputs are more than 90% of its nominal output voltage.

The default reset time is 32 ms. The polarity of the PGOOD is active high.

## Current Limit Protection

The TPS65253 current limit trip is set by the following formula for Buck 1:

$$I_{LIM1}(A) = \frac{252}{R_{LIM1}(k\Omega)} + 0.6 \quad (4)$$

and for Buck 2:

$$I_{LIM2}(A) = \frac{236}{R_{LIM2}(k\Omega)} + 0.56 \quad (5)$$

All converters operate in hiccup mode: Once an over-current lasting more than 12 ms is sensed in any of the converters, they will shut down for 20 ms and then the start-up sequencing will be tried again. If the overload has been removed, the converter will ramp up and operate normally. If this is not the case the converter will see another over-current event and shuts-down again repeating the cycle (hiccup) until the failure is cleared.

If an overload condition lasts for less than 12 ms, only the relevant converter affected will shut-down and re-start and no global hiccup mode will occur.

## Overvoltage Transient Protection

The device incorporates an overvoltage transient protection (OVP) circuit to minimize voltage overshoot. The OVP feature minimizes the output overshoot by implementing a circuit to compare the FB pin voltage to OVTP threshold which is 109% of the internal voltage reference. If the FB pin voltage is greater than the OVTP threshold, the high side MOSFET is disabled preventing current from flowing to the output and minimizing output overshoot. When the FB voltage drops lower than the OVTP threshold which is 107%, the high side MOSFET is allowed to turn on the next clock cycle.

## Low Power Mode Operation

By pulling high the Low\_P pin all converters will operate in pulse-skipping mode, greatly reducing the overall power consumption at light and no load conditions. Although each buck converter has a skip comparator that makes sure regulation is not lost when a heavy load is applied and low power mode is enabled, system design needs to make sure that the LP pin is pulled low for continuous loading in excess of 100 mA.

When low power is implemented, the peak inductor current used to charge the output capacitor is:

$$I_{LIMIT} = 0.25 \cdot T_{SLEEP\_CLK} \cdot \frac{V_{IN} - V_{OUT}}{L} \quad (6)$$

Where  $T_{SLEEP\_CLK}$  is half of the converter switching period,  $2/f_{SW}$ .

The size of the additional ripple added to the output is:

$$\Delta V_{OUT} = \frac{1}{C} \cdot \left( \frac{L \cdot I_{LIMIT}^2}{2} \cdot \frac{V_{IN}}{V_{OUT} \cdot (V_{IN} - V_{OUT})} - \frac{I_{LOAD}}{f_{SLEEP\_CLK}} \right) \quad (7)$$

And the peak output voltage during low power operation is (see [Figure 23](#)):

$$V_{OUT\_PK} = V_{OUT} + \frac{\Delta V_{OUT}}{2} \quad (8)$$

**Figure 23. Peak Output Voltage During Low Power Operation**

## Thermal Shutdown

The device implements an internal thermal shutdown to protect itself if the junction temperature exceeds 160°C. The thermal shutdown forces the device to stop switching when the junction temperature exceeds thermal trip threshold. Once the die temperature decreases below 140°C, the device reinitiates the power up sequence. The thermal shutdown hysteresis is 20°C.

## 3.3-V and 6.5 LDO Regulators

The following ceramic capacitor (X7R/X5R) should be connected as close as possible to the described pins:

- 4.7 µF to 10 µF for V7V pin 21
- 3.3 µF or larger for V3V pin 229

## Layout Recommendation

Layout is a critical portion of PMIC designs.

- Place tracing for output voltage and LX on the top layer and an inner power plane for VIN.
- For best thermal performance, pins 25, 26, 27, and 28 should be connected to GND on the top PCB layer as well as inner GND plane by through-hole connections.
- The top layer ground area should be connected to the internal ground layer(s) using vias at the input bypass capacitor, the output filter capacitor and directly under the TPS65253 device to provide a thermal path from the PowerPad land to ground.
- For operation at full rated load, the top side ground area together with the internal ground plane, must provide adequate heat dissipating area.
- There are several signals paths that conduct fast changing currents or voltages that can interact with stray inductance or parasitic capacitance to generate noise or degrade the power supplies performance. To help eliminate these problems, the VIN pin should be bypassed to ground with a low ESR ceramic bypass capacitor with X5R or X7R dielectric. Care should be taken to minimize the loop area formed by the bypass capacitor connections, the VIN pins, and the ground connections. Since the LX connection is the switching node, the output inductor should be located close to the LX pins, and the area of the PCB conductor minimized to prevent excessive capacitive coupling.
- The output filter capacitor ground should use the same power ground trace as the VIN input bypass capacitor. Try to minimize this conductor length while maintaining adequate width.
- The compensation should be as close as possible to the CMPx pins. The CMPx and ROsc pins are sensitive to noise so the components associated to these pins should be located as close as possible to the IC and routed with minimal lengths of trace.

## PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS65253RHDR	ACTIVE	VQFN	RHD	28	3000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS 65253	
TPS65253RHDT	ACTIVE	VQFN	RHD	28	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 85	TPS 65253	

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# MECHANICAL DATA

RHD (S-PVQFN-N28)

PLASTIC QUAD FLATPACK NO-LEAD

4204400/F 09/11

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - QFN (Quad Flatpack No-Lead) Package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
  - Falls within JEDEC MO-220.

## THERMAL PAD MECHANICAL DATA

RHD (S-PVQFN-N28)

PLASTIC QUAD FLATPACK NO-LEAD

### THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

RHD (S-PVQFN-N28)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for recommended solder mask tolerances and via tenting recommendations for vias placed in thermal pad.
